

Machine Learning Introduction

Tourism Facing Digital Transition

Emanuela Boros
University of La Rochelle, France

22-26 February 2021

Organization

1. 1.5h Course: Introduction to Machine Learning
2. 1.5h Lab Work: Tourist Review Classification
3. 1.5h Course: Introduction to Information Extraction
4. 1.5h Lab Work

- Course (slides and video) are available on Moodle
- Jupyter Notebook (lab work) is available on Moodle
- github classroom for sharing the lab work

Tourism Facing Digital Transition - Text Mining techniques

Text analysis/mining is the process of automatically **organizing** and **extracting** relevant information from **unstructured** text (documents, customer feedback, social media, email, etc.).

Having the texts classified (**text classification**) and **grouped by type**, the system tries to **extract useful information** from them.

Tourism Facing Digital Transition - Text Mining techniques

- **Text Classification:** the task of choosing correct class label for a given input
 - Deciding whether an is a spam or not (spam detection)
 - Deciding whether the topic of a news article is from a fixed list of topic areas such as “sports”, “technology”, and “politics” (document classification)
- **Sentiment Analysis (opinion mining):** identify and extract subjective information in source material
 - Online reviews, ratings and recommendations in social media sites for businesses looking to market their products, identifying new opportunities and manage their reputations
- **Topic Modeling:** algorithms for discovering the main themes that pervade a large and otherwise unstructured collection of documents
- **Named Entity Recognition:** methods for identifying entities in data (names, locations, organizations, etc.)
- **Relation Extraction:** discerns the relationships that exist among the entities detected in a text
- **Event Extraction:** discerns the entities + their relationships that exist among the entities and their roles in events

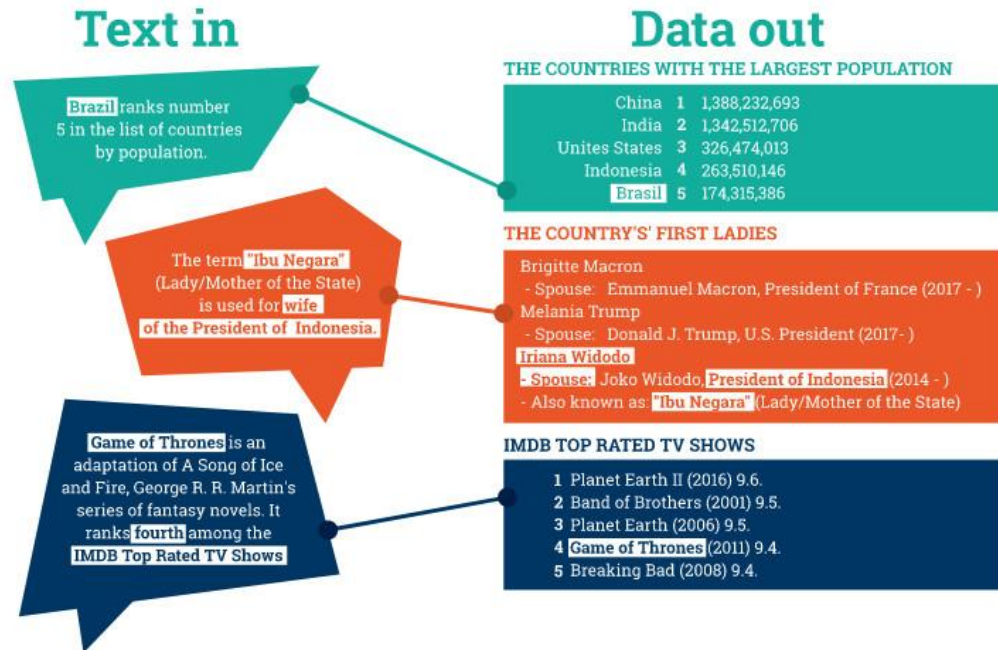

Information
Retrieval

Information
Extraction

Information Extraction - examples

Information Extraction systems extract clear, factual information → *Who did what to whom when?*

- identify relevant information from documents (financial news, or tourist information, medical documents), pulling information from a variety of sources and aggregates it into a structured form

Information Extraction - examples

Named Entity Recognition (NER)

A very important task: find and classify entities in text, for example:

"We had a very nice stay, the hotel is nicely situated in walking distance to the Eiffel tower and the exhibition halls of Porte de Versailles. Clean, nice hotel with a great neighborhood. We were about an hour walk to most of the big attractions (Eiffel Tower, Notre Dame, The Louvre). Some days we walked and some days we ubered or took the metro. Both Uber and Metro are easily navigated here. There is a metro very close by that runs conveniently through the city. The breakfast buffet has a large choice of fruits, bread etc. Can only recommend!"

Information Extraction - examples

Named Entity Recognition (NER)

A very important task: **find** and classify entities in text, for example:

"We had a very nice stay, the hotel is nicely situated in walking distance to the exhibition halls of **Porte de Versailles**. Clean, nice hotel with a great neighborhood. We were about an hour walk to most of the big attractions (**Eiffel Tower, Notre Dame, Louvre**). Some days we walked and some days we ubered or took the metro. Both **Uber** and **Metro** are easily navigated here. There is a metro very close by that runs conveniently through the city. The breakfast buffet has a large choice of fruits, bread etc. Can only recommend!"

Information Extraction - examples

Named Entity Recognition (NER)

A very important task: find and **classify** entities in text, for example:

"We had a very nice stay, the hotel is nicely situated in walking distance to the exhibition halls of **Porte de Versailles**. Clean, nice hotel with a great neighborhood. We were about an hour walk to most of the big attractions (**Eiffel Tower**, **Notre Dame**, **Louvre**). Some days we walked and some days we uberated or took the metro. Both **Uber** and **Metro** are easily navigated here. There is a metro very close by that runs conveniently through the city. The breakfast buffet has a large choice of fruits, bread etc. Can only recommend!"

Location

Organization

Information Extraction - examples

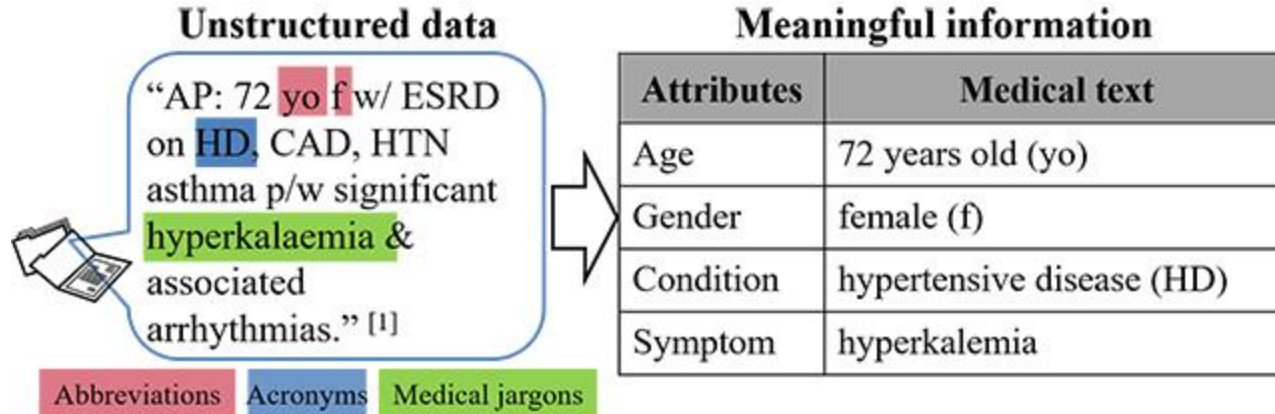

Named Entity Recognition (NER)

Type	Sample Categories	Example
People	Individuals, fictional Characters	<i>Turing</i> is often considered to be the father of modern computer science.
Organization	Companies, parties	<i>Amazon</i> plans to use drone copters for deliveries.
Location	Mountains, lakes, seas	The highest point in the <i>Catalinas</i> is <i>Mount Lemmon</i> at an elevation of 9,157 feet above sea level.
Geo-Political	Countries, states, provinces	The Catalinas, are located north, and northeast of <i>Tucson, Arizona, United States</i> .
Facility	Bridges, airports	In the late 1940s, <i>Chicago Midway</i> was the busiest airport in the United States by total aircraft operations.
Vehicles	Planes, trains, cars	The updated <i>Mini Cooper</i> retains its charm and agility.

In practice, named entity recognition can be extended to types that are not in the table above, such as temporal expressions (time and dates), genes, proteins, medical related concepts (disease, treatment and medical events) and etc.

Information Extraction - examples

Named Entity Recognition (NER)

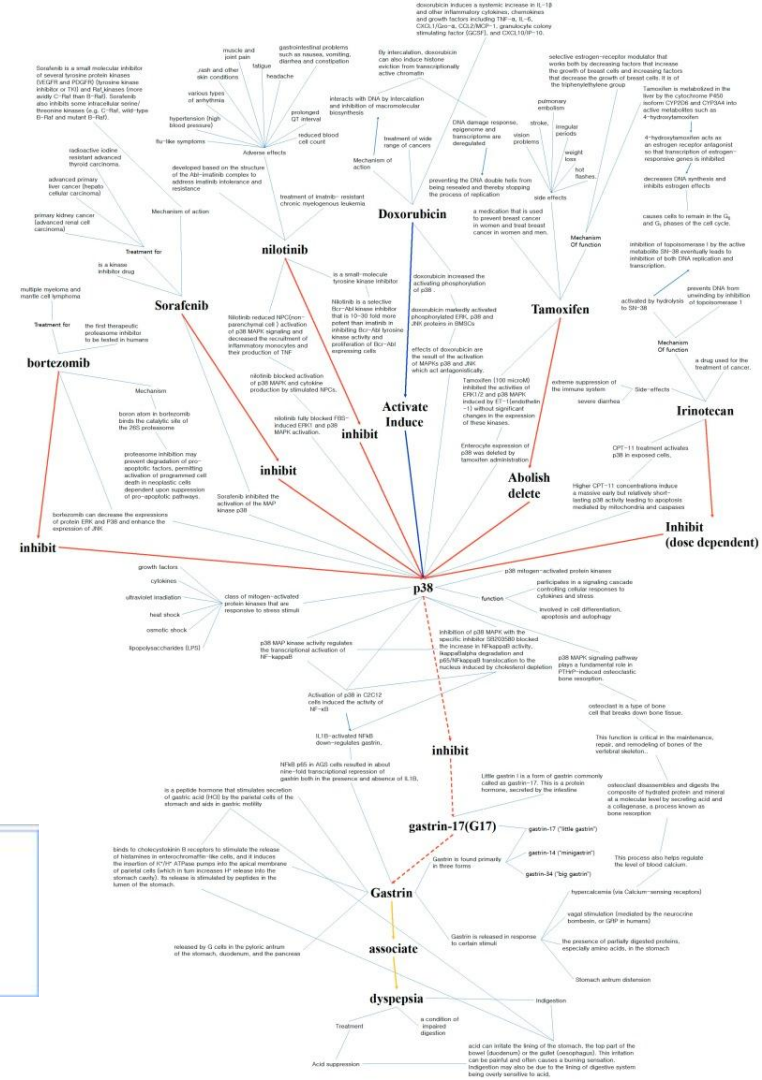

- medical related concepts (disease, treatment and medical events) and etc.
- online patient forums can provide valuable supplementary information on drug effectiveness and side effects

Relation Extraction (RE)

- **Mining medical texts:** discharge summaries, narrative patient records

- Protein binding relations useful for drug discovery
- Detection of gene-disease relations from biomedical literature
- Finding drug-side effect relations in health records

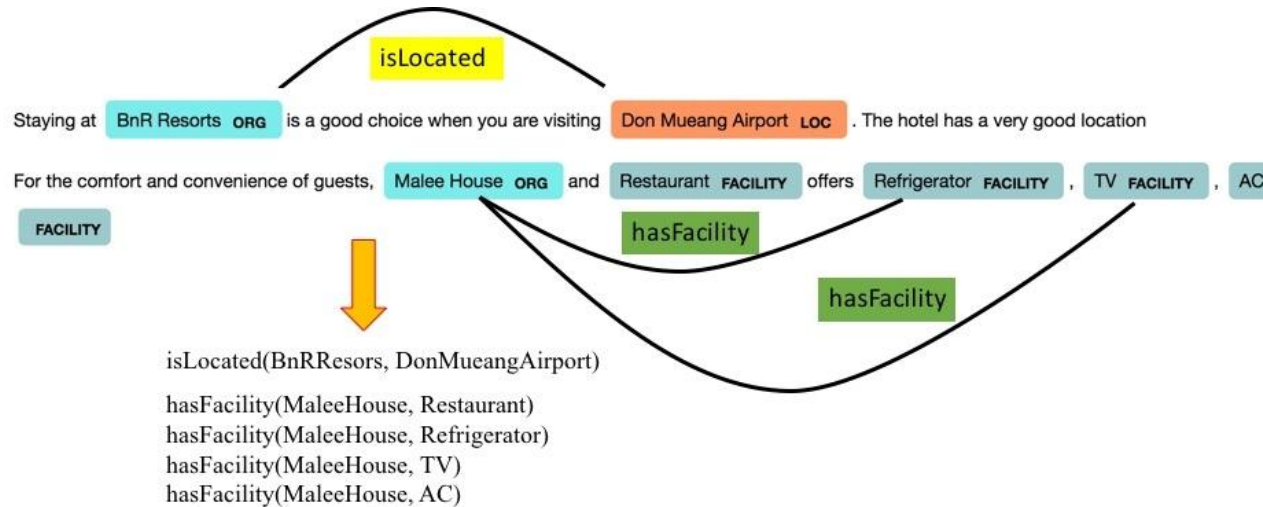

Information Extraction - examples

Relation Extraction (RE)

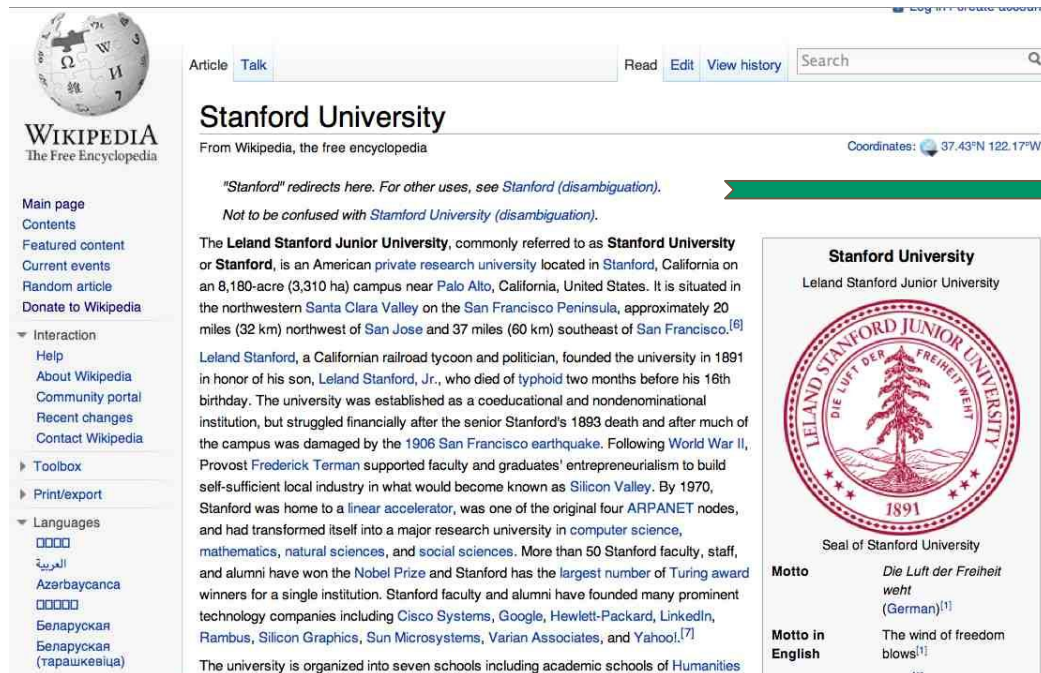

Relation extraction discerns the relationships that exist among the entities detected in a text.

- **Mining tourism texts:** documents, customer feedback, social media, email

Information Extraction - examples

Relation Extraction (RE)

The screenshot shows the Wikipedia page for Stanford University. A green arrow points from the article text to the right, where a list of relations is provided. The article text includes the following information:

- Stanford University** is an American **private research university** located in **Stanford, California** on an 8,180-acre (3,310 ha) campus near **Palo Alto, California, United States**. It is situated in the northwestern **Santa Clara Valley** on the **San Francisco Peninsula**, approximately 20 miles (32 km) northwest of **San Jose** and 37 miles (60 km) southeast of **San Francisco**.^[6]
- Leland Stanford**, a Californian railroad tycoon and politician, founded the university in 1891 in honor of his son, **Leland Stanford, Jr.**, who died of typhoid two months before his 18th birthday. The university was established as a coeducational and nondenominational institution, but struggled financially after the senior Stanford's 1893 death and after much of the campus was damaged by the **1906 San Francisco earthquake**. Following **World War II**, Provost **Frederick Terman** supported faculty and graduates' entrepreneurialism to build self-sufficient local industry in what would become known as **Silicon Valley**. By 1970, Stanford was home to a **linear accelerator**, was one of the original four **ARPANET** nodes, and had transformed itself into a major research university in computer science, **mathematics**, **natural sciences**, and **social sciences**. More than 50 Stanford faculty, staff, and alumni have won the **Nobel Prize** and Stanford has the **largest number of Turing award** winners for a single institution. Stanford faculty and alumni have founded many prominent technology companies including **Cisco Systems**, **Google**, **Hewlett-Packard**, **LinkedIn**, **Rambus**, **Silicon Graphics**, **Sun Microsystems**, **Varian Associates**, and **Yahoo!**.^[7]
- The university is organized into seven schools including academic schools of **Humanities**.

The relations extracted from the article are:

- Stanford **LOC-IN** California
- Stanford **IS-A** research university
- Stanford **LOC-NEAR** Palo Alto
- Stanford **FOUNDED-IN** 1891
- Stanford **FOUNDER** Leland Stanford

Information Extraction - examples

Event Extraction = Named Entity Recognition + Relation Extraction

[S1] ... by special urban troops, **four terrorists** have been arrested in soacha.

[S2] They are responsible for the **car bomb** attack on the **Newspaper El Espectador**, to a series of bogota **dynamite** attacks, to the freeing of a group of paid assassins.

[S3] The terrorists are also connected to the murder of **Teofilo Forero Castro**, ...

[S4] General Ramon is the commander of the 13th infantry brigade.

[S5] He said that at least two of those arrested have fully confessed to having taken part in the accident of **Luis Carlos Galan Sarmiento** in soacha, Cundinamarca.

[S6] .. triumph over organized crime, its accomplices and its protectors.

...

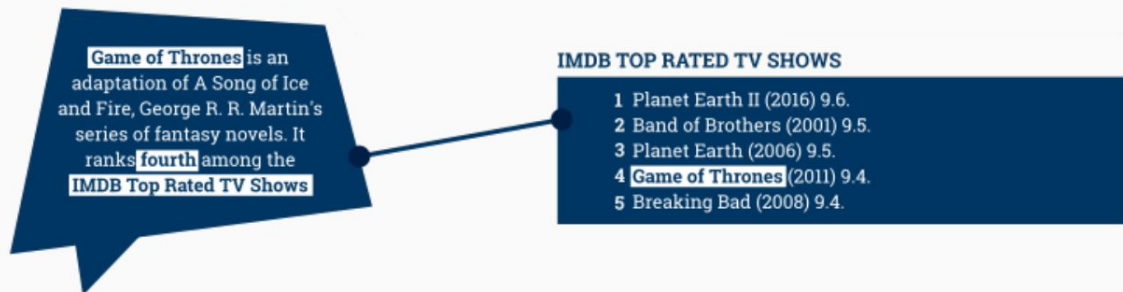

Perpetrator Individual	four terrorists
Perpetrator Organization	-
Target	Newspaper El Espectador
Victim	Teofilo Forero Castro, Luis Carlos Galan Sarmiento
Weapon	car bomb, dynamite

Attack event:

- entities
- relations

Information Extraction - examples

Named Entity Recognition (NER)

Game of Thrones: **TV Show**

A Song of Ice and Fire: **Book**

George R. R. Martin: **Author**

Relation Extraction (RE)

(A Song of Ice and Fire $\xrightarrow{\text{Book-Author}}$ George R. R. Martin)

Event Extraction (EE)

(Game of Thrones $\xrightarrow{\text{TV Show-Author}}$ George R. R. Martin $\xrightarrow{\text{Author-Book}}$ A Song of Ice and Fire)
